SANTA MARIA, NOVEMBRO DE 2004

# OBJETIVOS

→ Comparar a Coluna Total de Ozônio para os equipamentos Brewer e TOMS para o período 2002 – 2003.

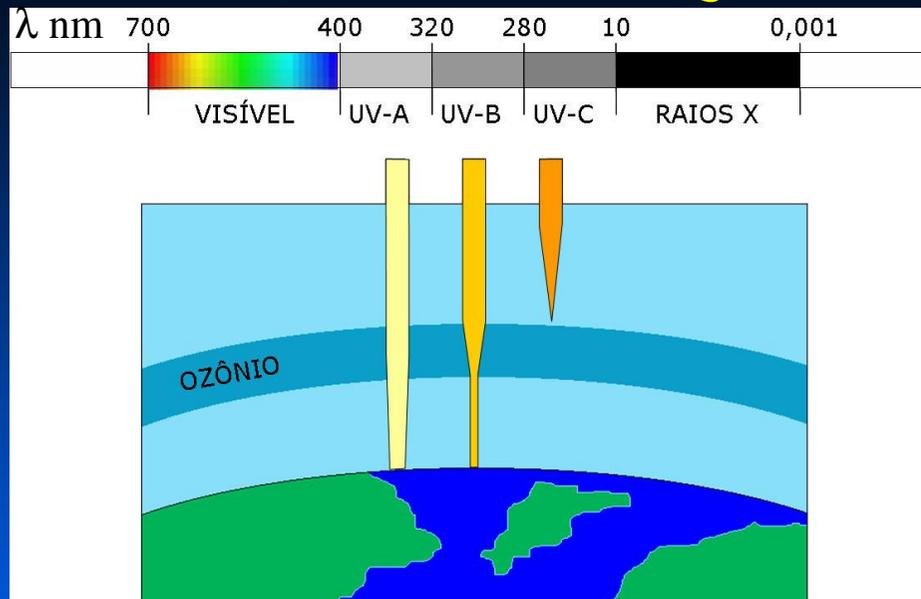

→ Avaliar a interferência das nuvens sobre a análise.

→ Comparar os métodos de medição da Coluna Total de Ozônio dos equipamentos utilizados nesta análise.

# INTRODUÇÃO

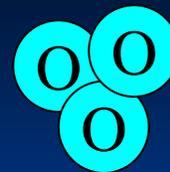

## A Radiação UV e o O<sub>3</sub>

Redução de O<sub>3</sub>

Maior incidência de Radiação UV!

Efeitos adversos à saúde humana

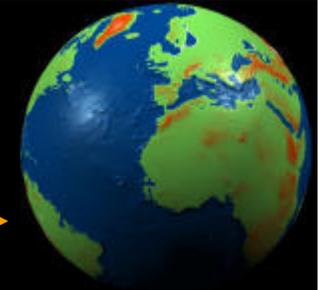

Melanoma

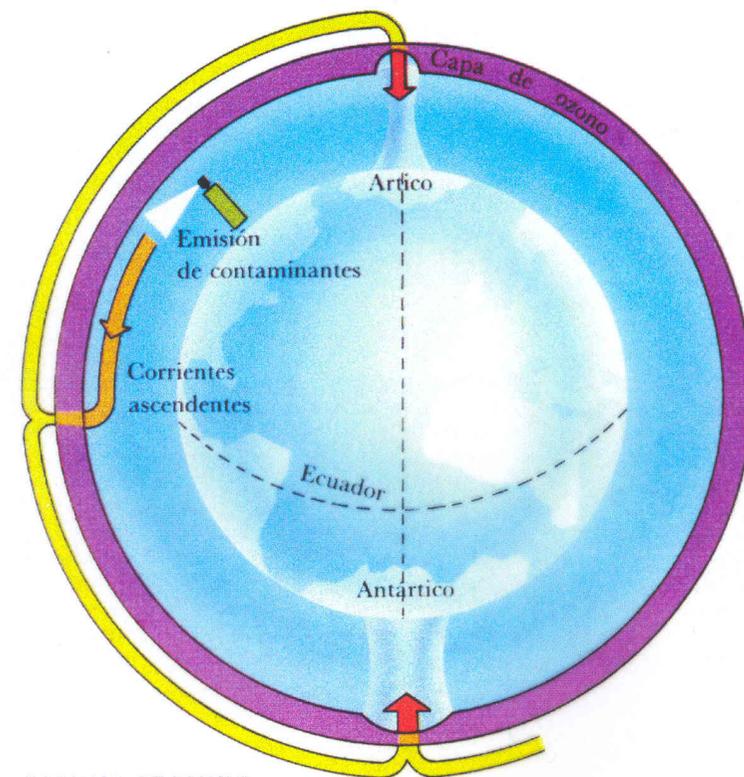

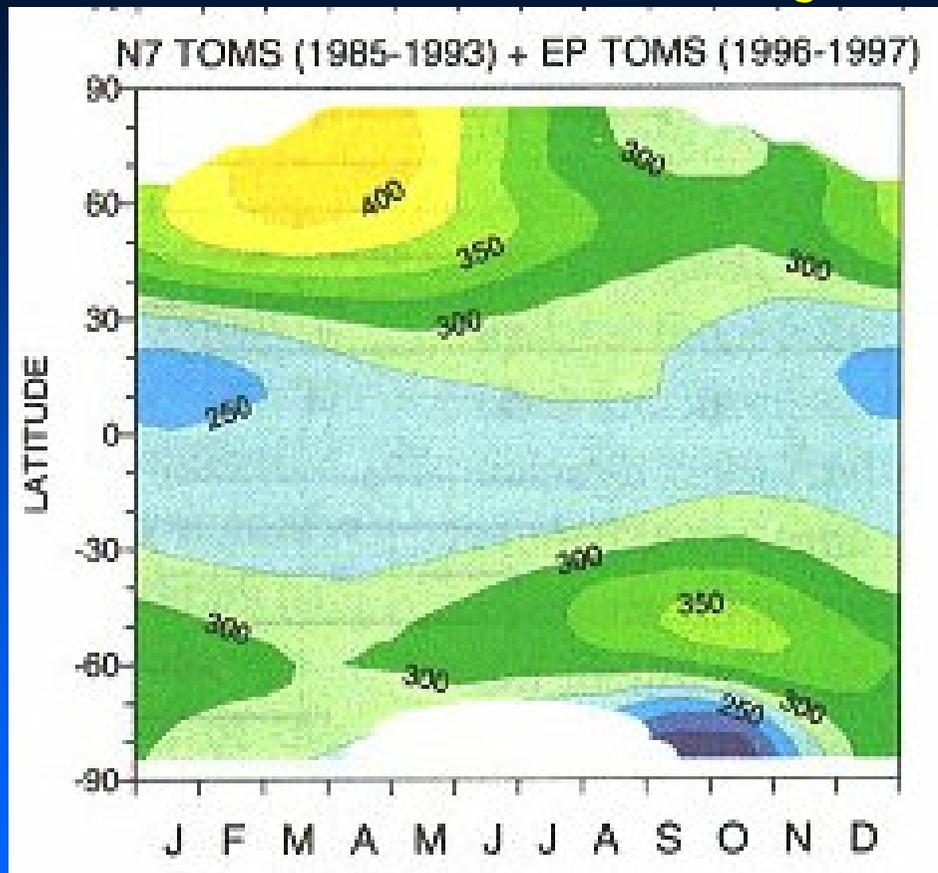

Envelhecimento precoce

# INTRODUÇÃO

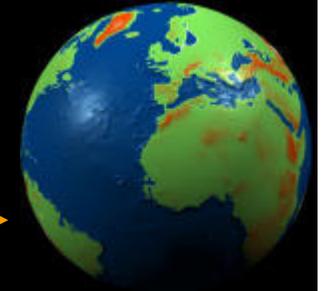

## Variação da Rad UV e O<sub>3</sub>

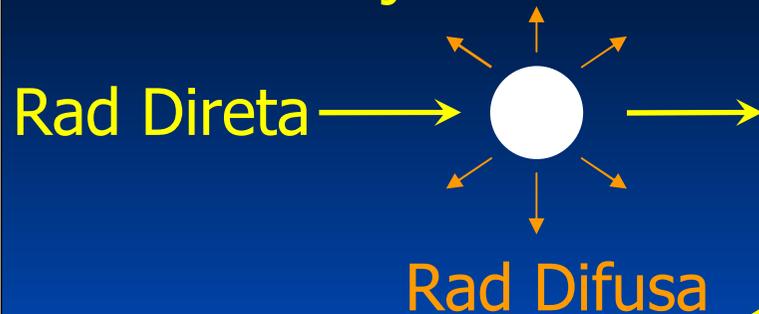

CAMINO SEGUIDO  
POR LOS CLOROFLUOROCARBUROS  
PARA LLEGAR A LOS POLOS

# INTRODUÇÃO

## As nuvens e o Espalhamento

$$\text{Radiação Solar} = \text{Rad Direta} + \text{Rad Difusa}$$

### Espalhamento

↳ Rayleigh

↳ Mie

↳ Múltiplo

# METODOLOGIA

## Equipamentos Utilizados

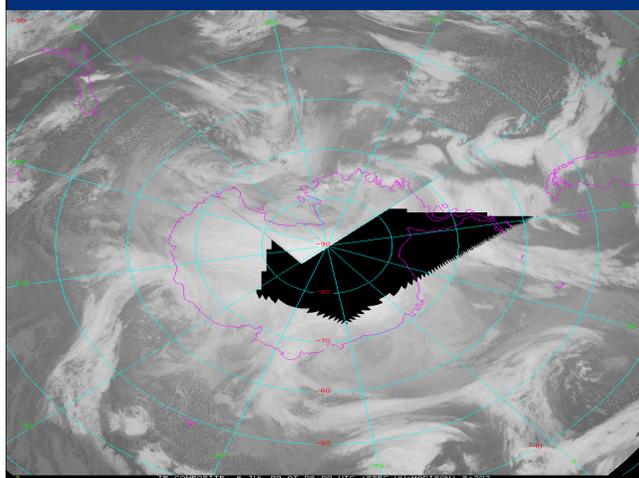

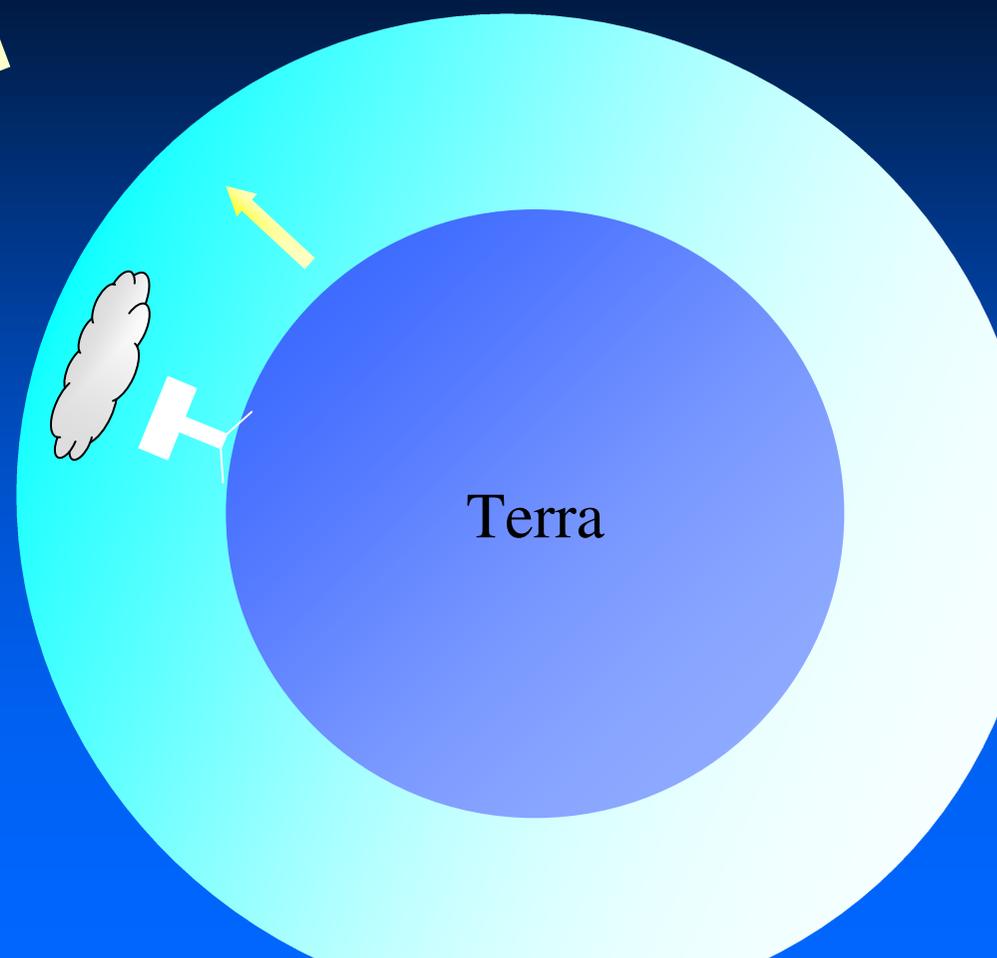

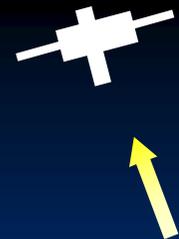

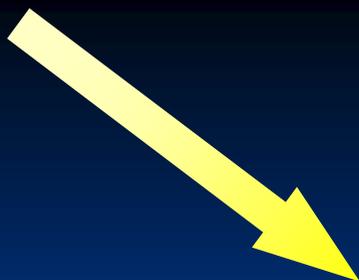

Espectrofotômetro  
Brewer

TOMS

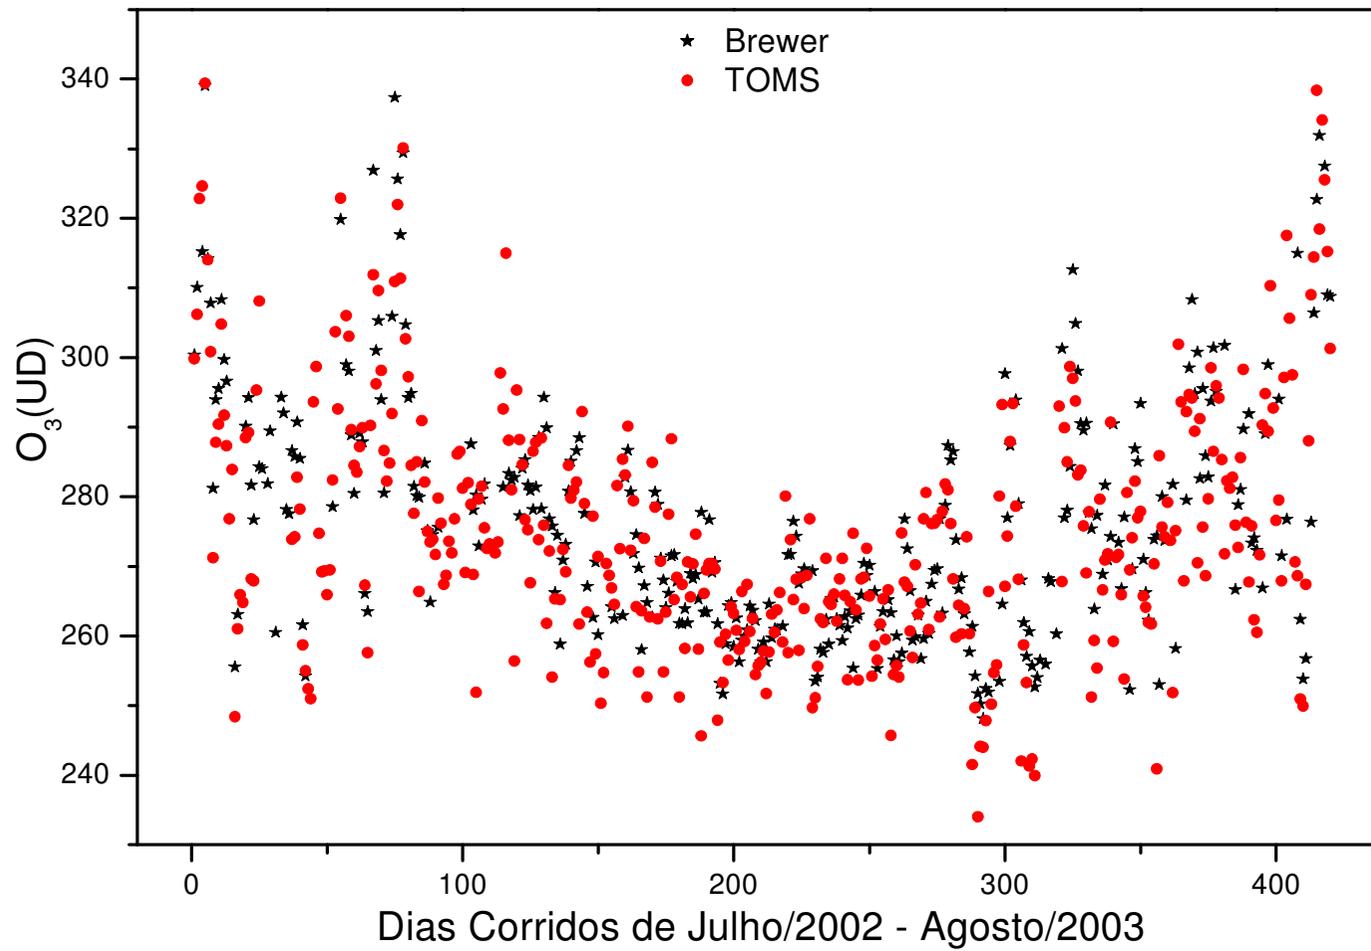

# METODOLOGIA

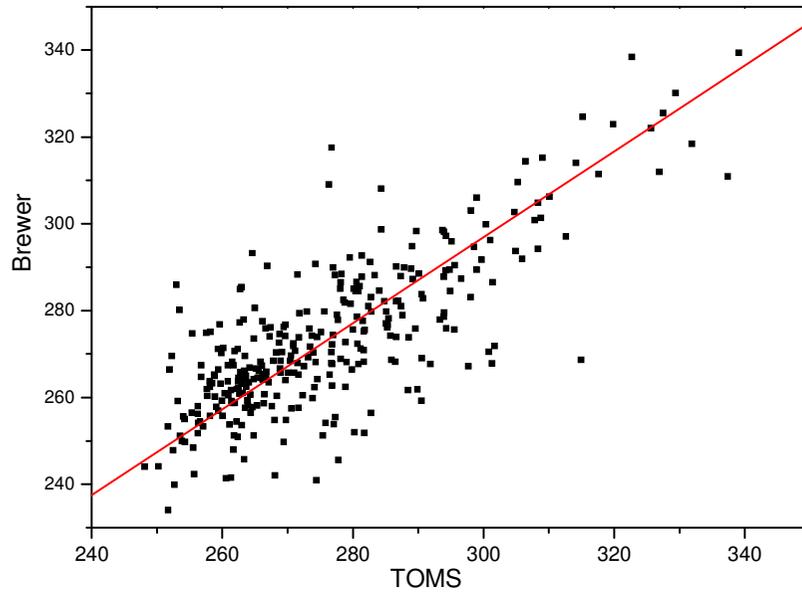

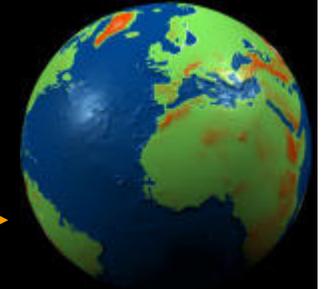

TOMS – Radiação refletida  
Brewer – Radiação incidente na superfície.

# RESULTADOS

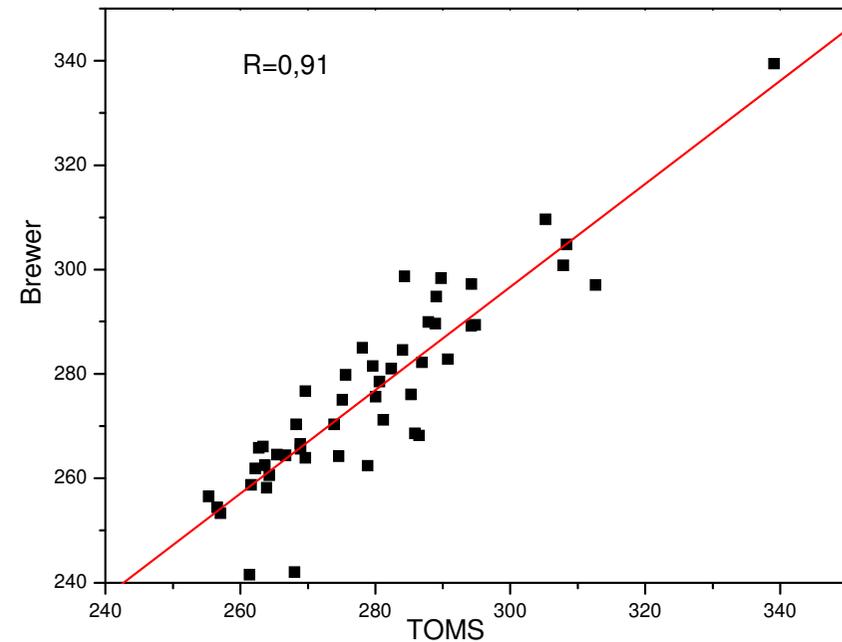

# RESULTADOS

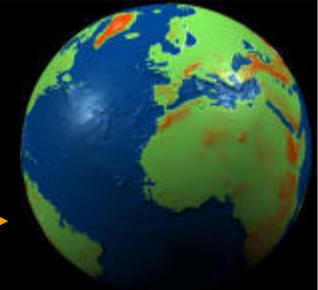

Correlação para todos os dias da análise  $R = 0,78$ .

Correlação para dias sem interferência de nuvens  $R = 0,91$ .

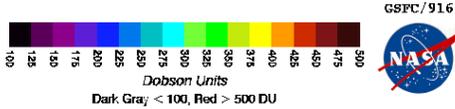

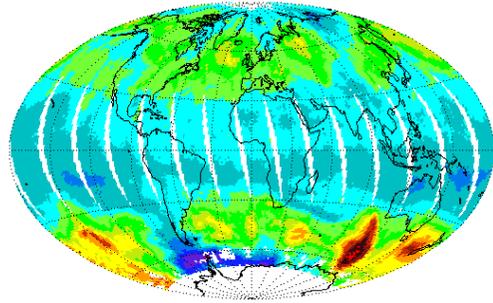

Totalizando 49 dias

# RESULTADOS

# CONCLUSÕES

Com base nas correlações pode-se concluir que o espalhamento das nuvens causaram interferência significativa.

Medidas terrestres são mais confiáveis que medidas por satélite.

Conclui-se que o Espectrofotômetro Brewer encontra-se operando de maneira satisfatória.
