INPE-607-RI/289

TÍTULO: MÉTODO DE REDUÇÃO DA PRESSÃO ATMOSFÉRICA AO NÍVEL DO MAR

AUTORES: H.M.T. Nunes e G.S.S. Nunes.

PROJETO: MESA

PUBLICADO EM FEVEREIRO DE 1975

Coordenador

Gerente do Projeto

I - INTRODUÇÃO

Com o objetivo de padronizar os procedimentos de redução da pressão atmosférica ao nível do mar, para todo o território nacional, foi criada a "Comissão para Recomendar um Método de Redução da Pressão Atmosférica ao Nível do Mar" que elaborou um relatório sobre o assunto.

Procuramos adotar no INPE um método de redução da pressão que estivesse o mais próximo possível do parecer desta Comissão, para que fosse mantida a uniformidade dos procedimentos meteorológicos.

LISTA DE SÍMBOLOS

C_m	Correção da umidade
fw	Fator de correção devido ao afastamento da mistura de ar e va por d'água da lei dos gases perfeitos
g	Aceleração da gravidade padrão local
mgp	Metrogeopotencial
P	Pressão atmosférica
P_o	Pressão atmosférica ao nível do mar
P_s	Pressão atmosférica ao nível da estação
$\overline{P}_s$	Pressão média anual ao nível da estação
$\overline{r}$	Razão de mistura média do dia
R_d	Constante dos gases para ar seco
T	Temperatura lida na hora da observação
T_{-12}	Temperatura lida 12 horas antes da observação
$\overline{T}$	Temperatura média da camada de ar fictícia
$\overline{T}^*$	Temperatura virtual média da camada de ar fictícia
T^*	Temperatura virtual
$\overline{T}_s$	Temperatura média do dia na estação
UR	Umidade relativa lida na hora da observação
UR_{-12}	Umidade relativa lida 12 horas antes da observação
$\overline{UR}$	Umidade relativa média do dia na estação
Z	Altitude
Z_s	Altitude da estação
$\overline{\gamma}$	Gradiente vertical adiabático seco de temperatura
ϕ	Latitude da estação
ρ	Densidade do ar

II - MÉTODO UTILIZADO

Os procedimentos para redução da pressão ao nível do mar baseiam-se no uso da equação hipsométrica que admite a hipótese de que a atmosfera está em equilíbrio hidrostático e se comporta como um gás perfeito.

Equação Hipsométrica

$$\frac{dP}{dZ} = - \rho g \qquad (1)$$

$$P = \rho R_d T \qquad (2)$$

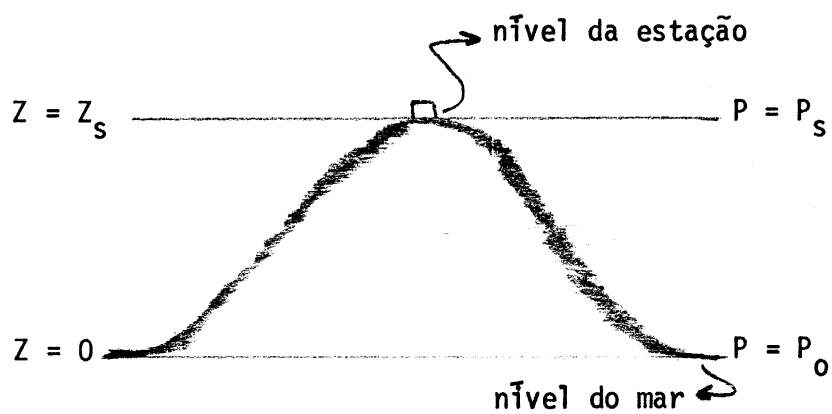
combinando-se (1) e (2) temos:

$$\frac{dP}{P} = - \frac{K}{T^*} dZ \qquad (3)$$

onde $K = 29.28980$ mgp/^oC.

Integrando (3) desde um nível P_o até P_s temos:

$$\ell nP_o - \ell nP_s = Z_s / K\overline{T}^*$$



onde $\overline{T}^*$ é a temperatura virtual média da camada de ar fictícia localizada entre P_o e P_s.

As dificuldades da redução de pressão ao nível do mar se encontram justamente no método de se determinar o valor da temperatura virtual desta camada de ar fictícia. Quando a altura da estação não é muito grande as pressões reduzidas parecem estar de acordo com as configurações sinóticas,mas se a estação está acima de 300 metros então os valores da pressão reduzida já começam a apresentar discrepâncias.

II.1 - Temperatura Virtual Média

A temperatura virtual média pode ser considerada como a soma da temperatura média mais uma correção devido a umidade:

$$\overline{T}^* = \overline{T} + C_m \qquad (4)$$

A temperatura virtual média da camada de ar fictícia poderá ser definida em função da temperatura e do teor de umidade ao nível da estação, de parâmetros pertinentes à estação, e de parâmetros pertinentes à atmosfera média.

II.2 - Temperatura Média

A temperatura média da camada de ar fictícia pode ser definida em função da temperatura da estação, da altura da estação e do gradiente vertical de temperatura adiabático seco.

$$\overline{T} = \overline{T}_s + \overline{\gamma}\, Z_s/2 \qquad (5)$$

onde $\overline{\gamma} = 0.0065^{o}C/mgp$ (para a atmosfera padrão)

Para suavizar os efeitos da variação diurna de temperatura, resolveu-se adotar um valor médio do dia para $\overline{T}_s$ através da fórmula:

$$\overline{T}_s = (T + T_{-12})/2$$

onde T = temperatura lida na hora da observação, e T_{-12} = temperatura lida 12 horas antes.

II.3 - Redução da unidade da altitude da estação de metros para metrogeopotencial

Para a estação de Cachoeira Paulista foi determinado para Z_s o valor: Z_s = 570 metros.

A relação entre metro e metrogeopotencial é dada pela fórmula:

$$Z_s(mgp) = \frac{gZ_s}{980} \text{ (metros)} \qquad (6)$$

onde g é a aceleração da gravidade padrão local ao nível da estação que por sua vez é função da altitude, e da latitude da estação:

$$g = f(\phi, Z_s) \qquad (7)$$

De acordo com a referência 3, obtivemos para Cachoeira

Paulista localizada a $23^{o}S$ de latitude o valor:

$$g = 978.642\ m^2/s^2$$

Aplicando a relação (6) obtivemos:

$$Z_s = 569.2\ mgp$$

II.4 - Correção da Umidade

A referência 1 indica para o fator da correção da umidade a relação:

$$C_m = 0.61\ \bar{r}\bar{T}_s$$

sendo que:

$$\bar{r} = f\ (fw, \bar{P}_s, \bar{T}_s, \overline{UR}),\ \overline{UR} = (UR + UR_{-12})/2$$

onde $\bar{P}_s$ é a pressão média anual ao nível da estação (para Cachoeira Paulista foi encontrado o valor de $\bar{P}_s$ = 950mb), fw é o fator de correção devido ao afastamento da mistura de ar e vapor d'água da lei dos gases perfeitos, $\bar{r}$ é a razão de mistura média do dia, e $\overline{UR}$ é a umidade relativa média do dia.

II.5 - Forma Final da Equação Hipsométrica

$$\ell nP_o = \ell nP_s + \frac{Z_s}{K(\bar{T} + C_m)}$$

III - CONSTRUÇÃO DAS TABELAS

A fim de facilitar os cálculos da redução da pressão foram idealizadas duas tabelas:

A primeira tabela (Tabela I) fornece o valor da temperatura virtual média da camada fictícia ($\overline{T}^*$ em ^oC) a partir da temperatura média do dia ao nível da estação ($\overline{T}_s$ em ^oC) e da umidade relativa média do dia ($\overline{UR}$ em %).

A segunda tabela (Tabela II) fornece o valor da pressão atmosférica (em mb) ao nível do mar P_o a partir do valor da pressão atmosférica (em mb) ao nível da estação P_s e da temperatura virtual média da camada fictícia ($\overline{T}^*$ em ^oC) obtida na Tabela I.

Foram construídas várias tabelas do tipo da Tabela I e da Tabela II, abrangendo todos os valores passíveis de ocorrência na atmosfera, para serem usadas especificamente em Cachoeira Paulista cujas características são definidas no texto.

Estas tabelas são apresentadas no Apêndice I e II.

IV - PROCEDIMENTOS PARA REDUÇÃO DA PRESSÃO

Os parâmetros necessários para reduzir a pressão atmosférica ao nível do mar são:

1. Pressão atmosférica ao nível da estação, P_s;
2. Temperatura do ar lida na hora da observação, T;
3. Temperatura do ar lida 12 horas antes da observação, T_{-12};
4. Umidade relativa lida na hora da observação, UR;
5. Umidade relativa lida 12 horas antes da observação, UR_{-12}.

Passos a serem seguidos:

1. Calcule a temperatura média do dia, $\overline{T}_s$, e a umidade relativa média do dia, $\overline{UR}$, usando as relações:

$$\overline{T}_s = (T + T_{-12})/2 \qquad (^oC)$$

$$\overline{UR} = (UR + UR_{-12})/2 \qquad (\%)$$

2. Calcule a temperatura virtual média da camada de ar fictícia $\overline{T}^*$, aplicando na Tabela I a temperatura média $\overline{T}_s$ e a umidade relativa média $\overline{UR}$ calculados no ítem 1.

3. Encontre o valor da pressão reduzida ao nível do mar na Tabela II, aplicando o valor da pressão ao nível da estação P_s e o valor da temperatura virtual média da camada $\overline{T}^*$ calculado no ítem 2.

Exemplo

Foi realizada a observação e foram conseguidos os seguintes valores:

Pressão atmosférica: $P_s = 950.3mb$

Temperatura do ar: $T = 25^oC$

Umidade relativa: $UR = 60\%$

12 horas antes da observação foram conseguidos os valores:

Temperatura do ar: $T_{-12} = 22^oC$

Umidade relativa: $UR_{-12} = 55\%$

1. Calculo da temperatura média do dia $\overline{T}_s$ e da umidade relativa média do dia $\overline{UR}$:

$$\overline{T}_s = (T + T_{-12})/2 \qquad (^oC)$$

$$\overline{T}_s = (22 + 25)/2 = 47/2$$

$$\overline{T}_s = 23.5$$

$$\overline{UR} = (UR + UR_{-12})/2$$

$$\overline{UR} = (60 + 55)/2 = 115/2$$

$$\overline{UR} = 57.5 = 60\%$$

Nota: Aproximar sempre o valor para números inteiros múltiplos de cinco.

2. Calculo da temperatura virtual média $\overline{T}^*$ utilizando-se a Tabela I.

Localize na coluna $\overline{T}_s$ o valor da temperatura $\overline{T}_s = 23.5^oC$, e na coluna $\overline{UR}$ o valor da umidade relativa $\overline{UR} = 60\%$ calculados no ítem 1.

Estes valores resultarão em $\overline{T}^* = 25.6^oC$. Aproxime este valor para um múltiplo de cinco mais próximo. No caso $\overline{T}^* = 25.5^oC$.

3. Redução da pressão ao nível do mar utilizando-se a Tabela II.

Localize na coluna P_s o valor da pressão ao nível da estação: $P_s = 950.3mb$ e na coluna $\overline{T}^*$ o valor da temperatura virtual $\overline{T}^* = 25.5^oC$ calculado no ítem 2.

Estes valores resultarão em $P_o = 1014.1mb$ que é o resultado da pressão reduzida ao nível do mar.

APÊNDICE I

Tabelas para o cálculo do valor da temperatura virtual média da camada fictícia ($\overline{T^*}$ em ^oC) a partir da temperatura ($\overline{T_s}$ em ^oC) e umidade relativa ($\overline{UR}$ em %) médias do dia ao nível da estação, para a estação de Cachoeira Paulista.

Os valores da temperatura média do dia ao nível da estação ($\overline{T_s}$ em ^oC) são apresentados na ordenada.

Os valores de umidade relativa média do dia ($\overline{UR}$ em %) ao nível da estação são apresentados na abcissa.

APÊNDICE II

Tabelas para o cálculo da pressão ao nível do mar (P_o em mb) a partir do valor da pressão ao nível da estação (P_s em mb) e da temperatura virtual média da camada fictícia ($\overline{T}^*$ em ^oC) obtida nas tabelas do Apêndice I, para a estação de Cachoeira Paulista.

Os valores da pressão ao nível da estação (P_s em mb) são apresentados na abcissa.

Os valores da temperatura virtual média da camada fictícia ($\overline{T}^*$ em ^oC) são apresentados na ordenada.
