II Workshop em Modelagem Regional de  
Tempo e Clima Utilizando o Modelo Eta:

Aspectos Físicos e Numéricos

Cachoeira Paulista

Maio/2007

Desenvolvimentos Numéricos no Modelo Regional Eta - Módulo I

# Previsibilidade da Atmosfera

Sistemas dinâmicos Instáveis

Sistemas dinâmicos Estáveis

Perturbações de pequena amplitude afetam a atmosfera:

- pequenos erros nas observações tendem a dobrar em 3 dias (grande escala).
- pequenos erros na mesoescala dobram em horas.
- erros da pequena escala geram erros na macroestrutura.

## Previsões por Conjunto (Ensemble)

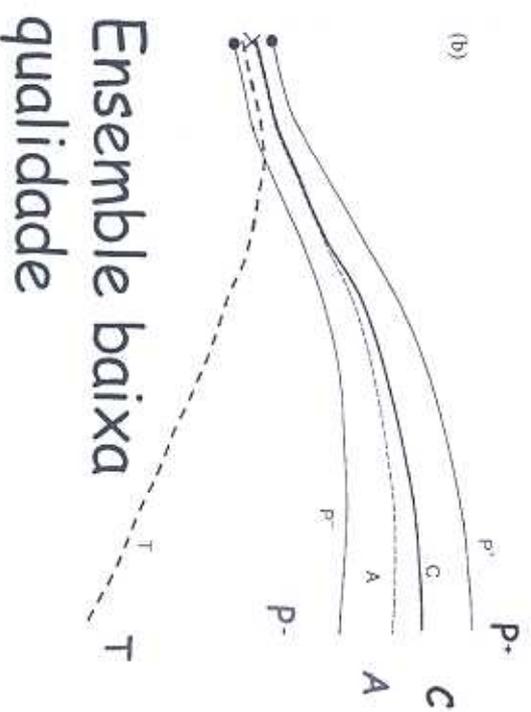

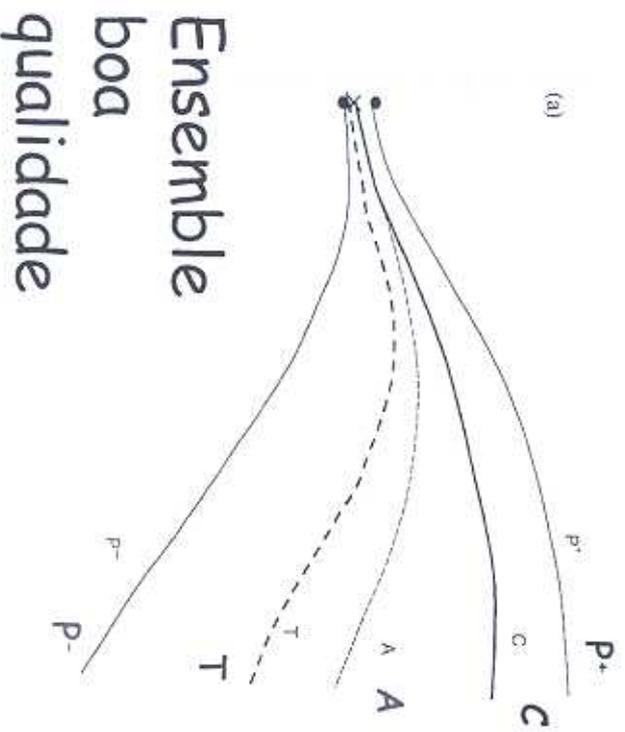

Explorar de maneira sistemática a natureza caótica da atmosfera..

Eficiência da previsão depende:

- acurácia das condições iniciais.
- precisão dos modelos.
- instabilidades.

## Principais objetivos de uma previsão por ensemble:

- Ensemble médio (ensemble médio tende a filtrar os componentes da previsão que são incertos e manter os componentes que mostram concordância).
- Medir a confiabilidade da previsão.
- Base quantitativa para previsões probabilísticas.

C - previsão  
controle

P+ - pert. positiva

P- - pert. negativa

A - ensemble médio

T - estado real da  
atmosfera

# Previsões por Ensemble de Curto Prazo

## SREP - Metodologia

Duas fontes de incertezas:

### • *CONDIÇÕES INICIAIS*

- Os dados observacionais não podem ser medidos com infinito grau de precisão.

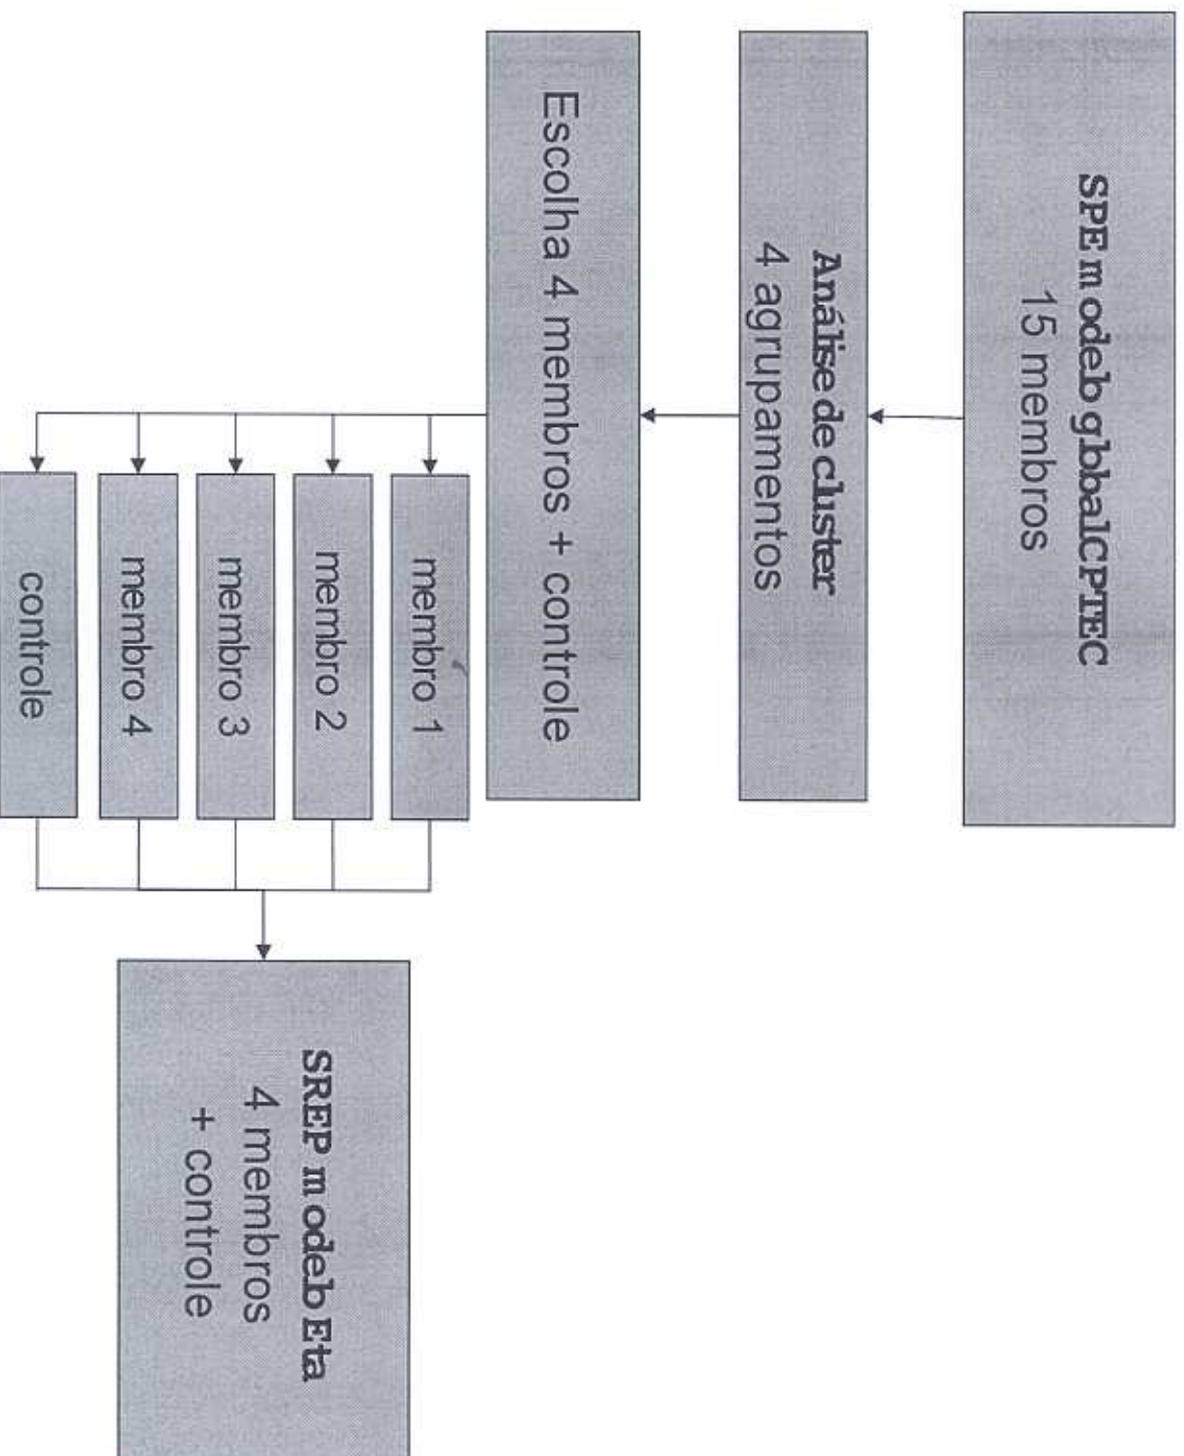

Ensemble Condição Inicial - ENSCI

### • *DEFICIÊNCIAS DOS MODELOS.*

- Equações utilizadas pelos modelos não capturam todos os processos na atmosfera.
- Resolução dos modelos não é suficiente para capturar todas as características da atmosfera.

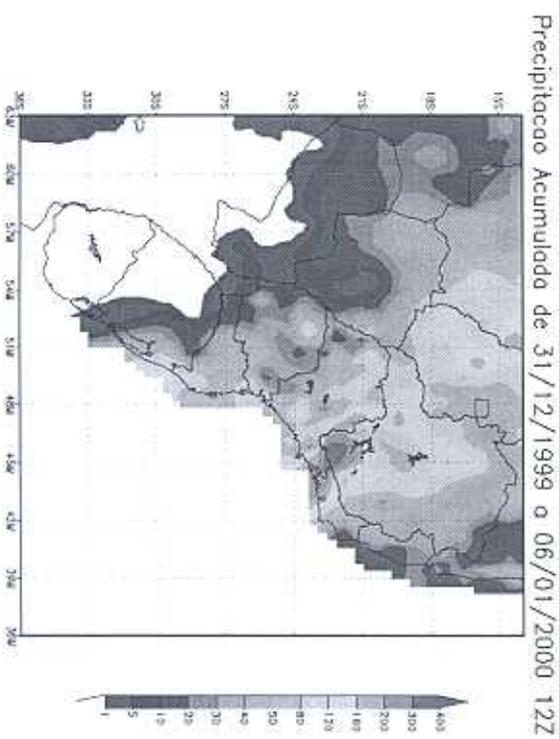

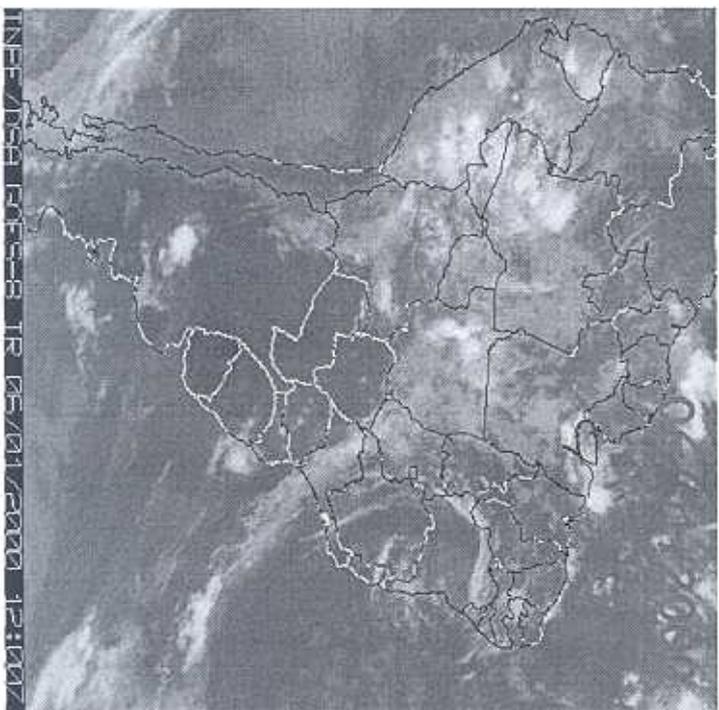

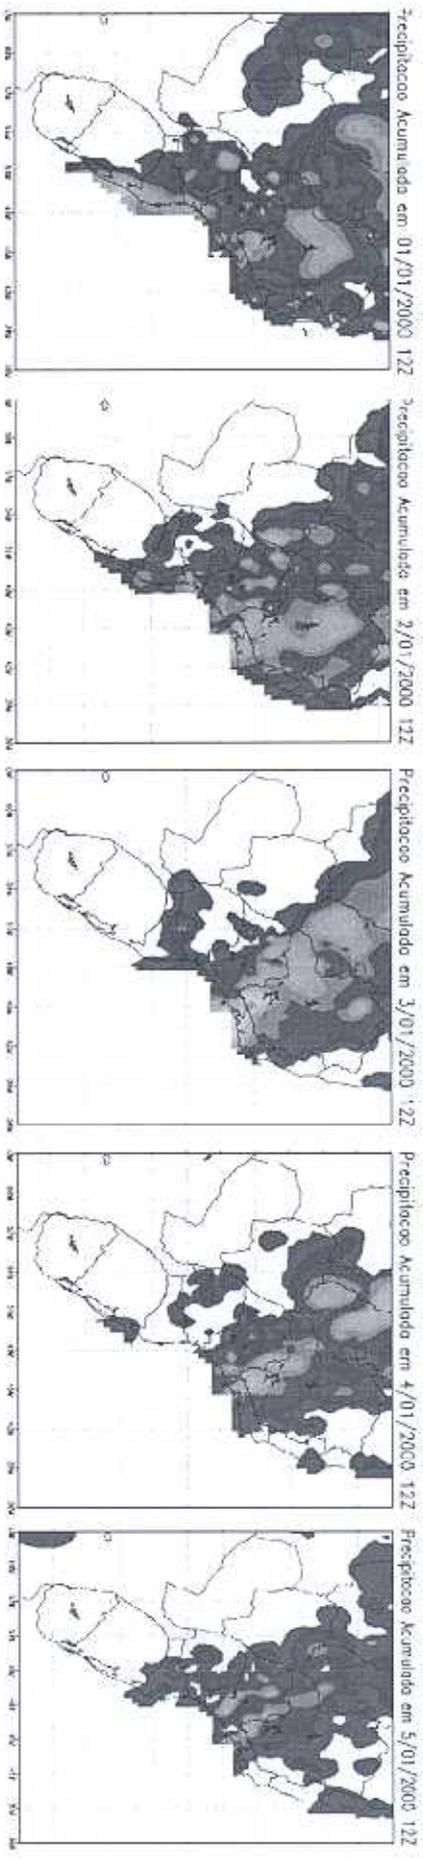

Ensemble Física - ENSFIS

ZCAS2000

Caragua2006

# **SREP usando Modelo Eta      Conclusões preliminares**

## **CASO ZCASA2000**

- 1- Padrão da precipitação melhor previsto pelo SREP.
- 2- Probabilidade de valores de precipitação intensa é pequena.
- 3- Ensemble médio padrões mais próximo ao observado que o controle.

## **CASO CARAGUA2006**

- 1- Dificuldade de previsão da precipitação ocorrida.
- 2- Baixa qualidade da análise utilizada como condição inicial.
- 3- SREP agregou pequeno valor a previsão, porém Ensemble Médio indica mais chuva que o Eta40.

## **GERAL**

- 1- Ensemble médio representam os padrões de precipitação.
- 2- Espalhamento com comportamento similar ao erro da previsão.
- 3- Subestimativa dos valores intensos de precipitação.
- 4- ENSFIS.
